Question: A box contains 5 red marbles, 8 white marbles and 4 green marbles. One marble is taken out of the box at random. What is the probability that the marble taken out will be:

- (i) red?
- (ii) white?
- (iii) not green?

Solution:

Number of red marbles = Number of white marbles = Number of green marbles = Total marbles = 5+8+4=17

X	Outcome
0	Red Marble
1	White Marble
2	Green Marble

(i) Probability that the marble taken out is red

$$= \frac{\text{Number of red marbles}}{\text{Total number of marbles}}$$
 (1)

Probability that the marble taken out is red:

$$\Pr(X=0) = \frac{n(X=0)}{\sum_{i=0}^{2} n(X=i)} = \frac{5}{17}$$
 (2)

$$\therefore \Pr(X = 0) = \frac{5}{17} \approx 0.2941$$
 (3)

(ii) Probability that the marble taken out is white

$$= \frac{\text{Number of white marbles}}{\text{Total number of marbles}} \tag{4}$$

Probability that the marble taken out is white:

$$\Pr(X=1) = \frac{n(X=1)}{\sum_{i=0}^{2} n(X=i)} = \frac{8}{17}$$
 (5)

$$\therefore \Pr(X = 1) = \frac{8}{17} \approx 0.4706 \tag{6}$$

(iii) Probability that the marble taken out is not green

$$= \frac{\text{Number of non green marbles}}{\text{Total number of marbles}}$$
 (7)

Probability that the marble taken out is not green:

$$\Pr(X \neq 2) = \frac{n(X \neq 2)}{\sum_{i=0}^{2} n(X = i)} = \frac{13}{17}$$
 (8)

$$\therefore \Pr(X \neq 2) = \frac{13}{17} \approx 0.7647 \tag{9}$$
